## (54) PREPARATION OF SPHERICAL CALCIUM CARBONATE

## (57) Abstract:

**PURPOSE:** To prepare calcium carbonate having spherical vaterite structure stable even in the presence of water, and suitable as an abrasive for toothpaste, by reacting a water-soluble calcium salt with a carbonate in an aqueous solution in the presence of a bivalent cation other than Ca.

**CONSTITUTION:** Spherical vaterite-type calcium carbonate stable even in the presence of water can be prepared by mixing and reacting (A) an aqueous solu-

tion of a water-soluble calcium salt such as calcium chloride, calcium acetate, etc. with (B) equimolar amount of an aqueous solution of a carbonate such as sodium carbonate, ammonium carbonate, etc. and (C) a bivalent cation other than Ca (e.g. Sr ion, Mg ion, etc.). The amount of the cation is 0.005W/0.5wt% of the water-soluble calcium salt. When the calcium carbonate prepared above is used e.g. as an abrasive for toothpaste, it keeps the spherical shape stably for a long period even in the presence of water, and since it is spherical, it exhibits mild abrasive action and gives excellent feeling to the mouth.
